

Improving Internet on the Unicorn Farm

A working farm spread across several sheds and a homestead was running the whole business on one weak connection at the house. Payroll, livestock software and cameras all fought for the same trickle of bandwidth.

KEY RESULTS

6x

usable bandwidth at the sheds

99.9%

uptime with automatic failover

0

dropped calls reported since cutover

BEFORE

- Single fixed wireless service at the homestead with no coverage past the first shed
- Office staff dropping out of cloud accounting and video calls several times a day
- Security cameras and weather sensors offline whenever anyone streamed or backed up
- No failover, so a single outage stopped orders and deliveries for the day

AFTER

- 6x - usable bandwidth at the sheds
- 99.9% - uptime with automatic failover
- 0 - dropped calls reported since cutover
- Site survey of every building, yard and shed with signal mapping before quoting anything

"We used to plan our paperwork around when the internet felt like working. Now it just works, everywhere on the property."

- Farm operations manager
